Reproducible research

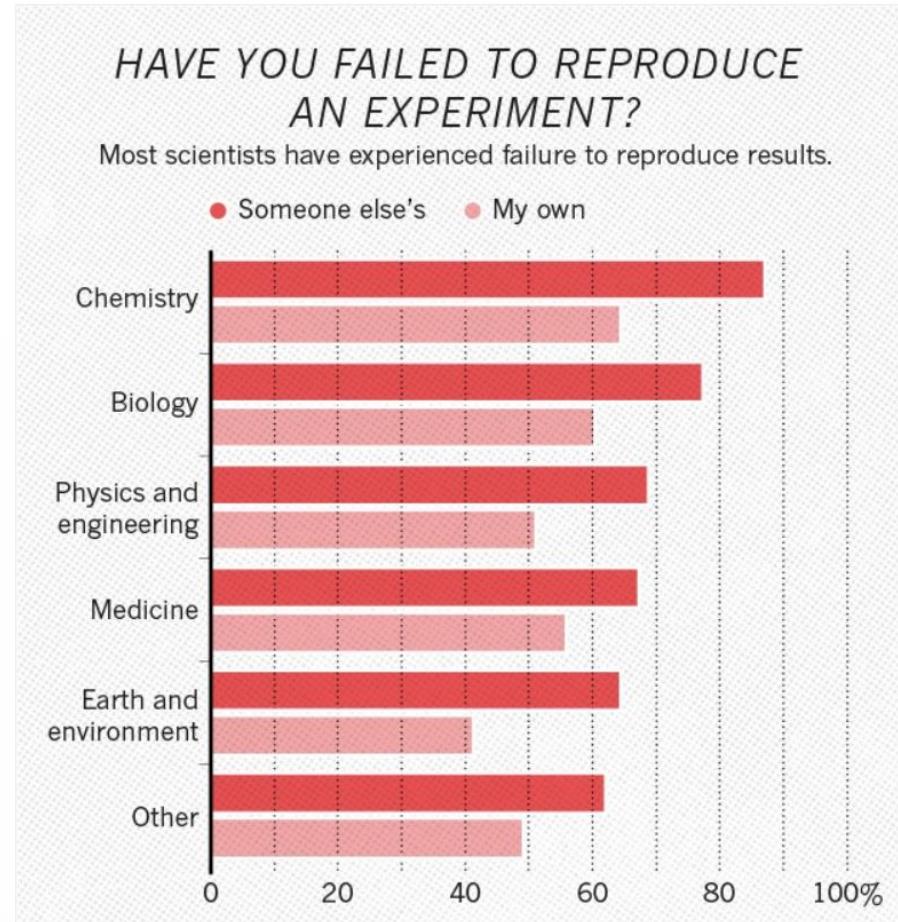

Source: *Nature*, 2016

Sharing code

- Make analysis scripted & public
- Distribute
- Further development
- Reproducibility

GROWING INFLUENCE OF GITHUB

An increasing proportion of research articles cite GitHub in their references.

Source: *Nature*, 2016

Reproducible research

"Most computational hydrology is not reproducible, so is it really science?"

Hutton et al., 2016

Reproducible research

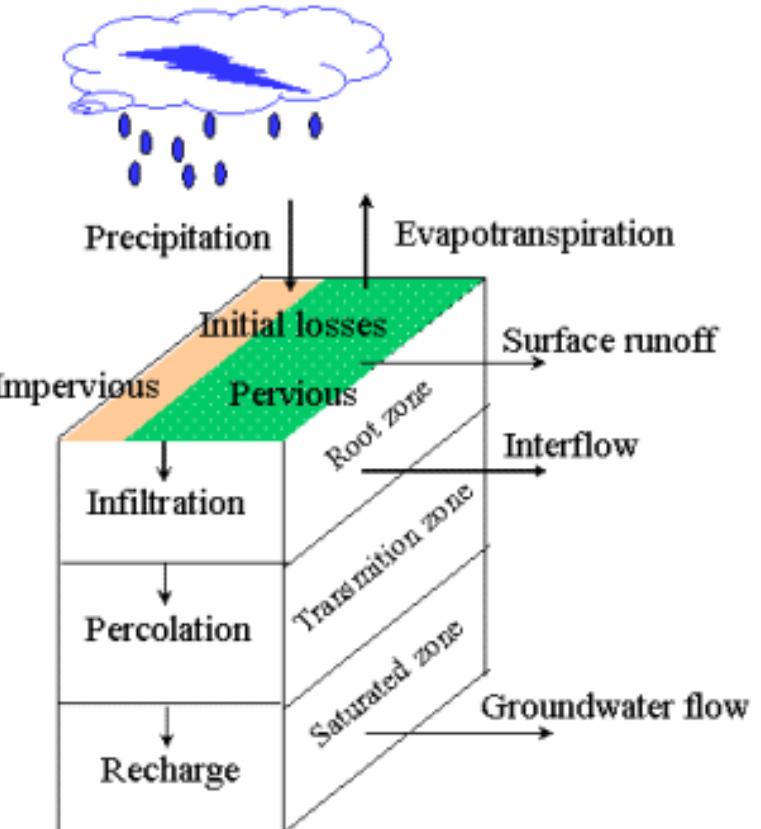

"Most computational hydrology is not reproducible, so is it really science?"

Hutton et al., 2016

- Can be improved by scripted analysis & open source sharing

HYDR code

- HYDR has developed:
 - Software
 - Tools
 - Publications

Source: VUB

GitHub

- Online code hosting
- Open source
- Used for sharing & collaborating on code

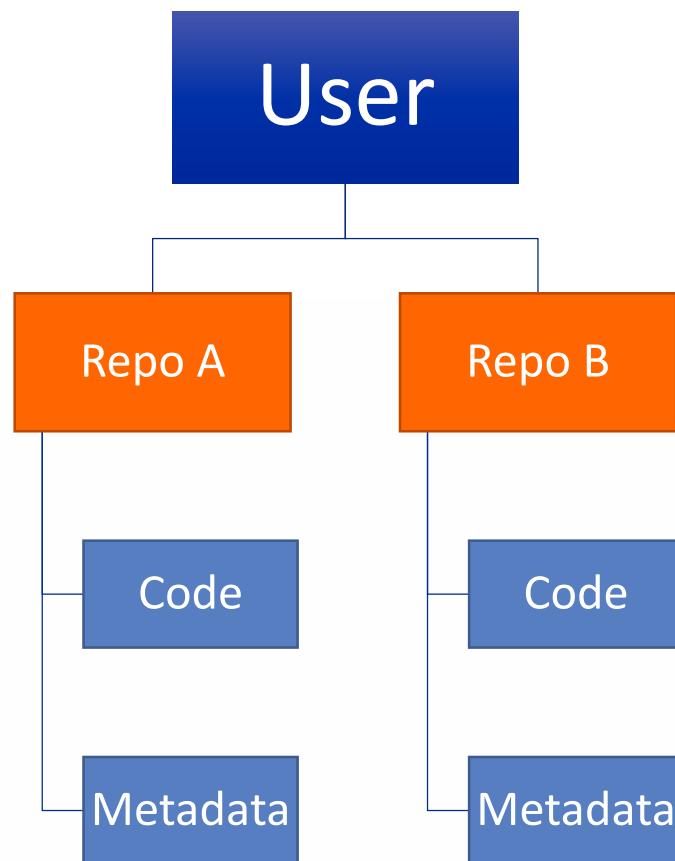

GitHub

- Uses Git software at its core
 - Version control
 - “Keeping track of who changed what where”

GitHub structure

HYDR GitHub

- GitHub organization
- Members
- Centralized repo's
- Easy to collaborate and discuss

<https://github.com/VUB-HYDR>

The screenshot shows the GitHub organization page for HYDR. At the top, there is a header with the HYDR logo, the name 'HYDR', the description 'Department of Hydrology and Hydraulic Engineering at VUB', the location 'Brussels, Belgium', and the website 'http://www.hydr.vub.ac.be/'. Below the header, there is a navigation bar with tabs for 'Repositories' (18), 'Packages', 'People' (15), 'Teams' (1), 'Projects', and 'Settings'. There are also search bars for 'Find a repository...', 'Type: All', 'Language: All', and buttons for 'Customize pins' and 'New'. On the left, there is a list of repositories: 'QSWAT_Automated_Workflow', 'REVUB', and 'TREX'. Each repository has a brief description, tags, and statistics. To the right, there are three boxes: 'Top languages' (Python, MATLAB, Ruby, Jupyter Notebook), 'Most used topics' (publication, tool, climate, spqb, thiery), and 'People' (a grid of 15 user profiles).

Slug Test Analysis

Python scripts for the plotting and analysis of rising-head slugtests.

For users

This repository includes python scripts for the plotting and analysis of rising head slugtests. K values are calculated with the Bouwer & Rice (1976) method modified for anisotropy by Zlotnik (1994) and the Hvorslev (1951) method. The guidelines of Butler (1997) are used for the selection of normalized heads: normalized heads in the range of 0.20-0.30 for Bouwer and Rice (1976) and 0.15-0.25 for Hvorslev (1951).

Data analysis and modelling used in Vanderkelen et al., 2018 a and b.

DOI10.5281/zenodo.1464820

For users

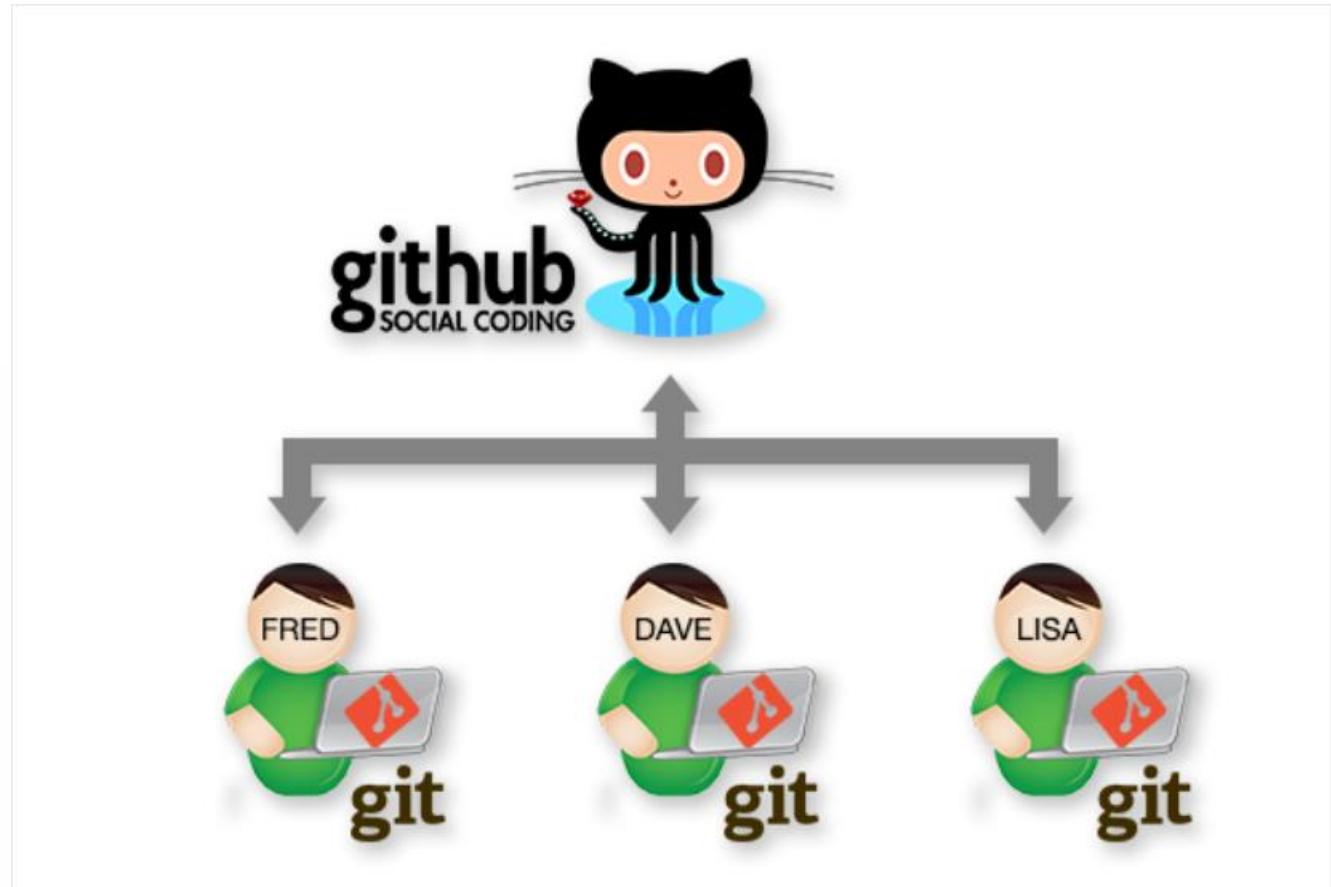

This repository includes the processing scripts of the Water Balance Model (WBM) for Lake Victoria. The main analysis is performed in *Matlab 2017b*. The four different components of the repository are described below.

1. WBmodel

This folder contains all the necessary scripts to run the WBM forced by observations as done in Vanderkelen et al. (2018a)

HYDR GitHub

- Collaboration
 - Git = version control

Source: McWilliams, 2013

Pros & cons

Pro:

- Reproducible research
- Code/tool sharing
- Collaboration → improvement
- Analysis should be scripted

Pros & cons

Pro:

- Reproducible research
- Code/tool sharing
- Collaboration → improvement
- Analysis should be scripted

Con:

- Git has a steep learning curve
- Maintenance
- Analysis should be scripted
- Needs quality control
