### Information literacy: perceptions of Brazilian HIV/AIDS researchers.

Alvarez Mdo C<sup>1</sup>, França I Jr, Cuenca AM, Bastos FI, Ueno HM, Barros CR, Guimarães MC.

Author information

**Abstract**

**BACKGROUND:** Information literacy has evolved with changes in lifelong learning. Can Brazilian health researchers search for and use updated scientific information?

**OBJECTIVES:** To describe researchers' information literacy based on their perceptions of their abilities to search for and use scientific information and on their interactions with libraries.

**METHODS:** Semi-structured interviews and focus group conducted with six Brazilian HIV/AIDS researchers. Analyses comprised the assessment of researchers as disseminators, their interactions with librarians, their use of information and communication technology and language.

**RESULTS:** Interviewees believed they were partially qualified to use databases. They used words and phrases that indicated their knowledge of technology and terminology. They acted as disseminators for students during information searches. Researchers' abilities to interact with librarians are key skills, especially in a renewed context where libraries have, to a large extent, changed from physical spaces to digital environments.

**DISCUSSION:** Great amounts of information have been made available, and researchers' participation in courses does not automatically translate into adequate information literacy. Librarians must help research groups, and as such, librarians' information literacy-related responsibilities in Brazil should be redefined and expanded.

**CONCLUSIONS:** Students must develop the ability to learn quickly, and librarians should help them in their efforts. Librarians and researchers can act as gatekeepers for research groups and as information coaches to improve others' search abilities.

**Abstract**

Current nonpharmacological approaches, including diet and exercise interventions, for preventing and treating gestational diabetes mellitus are effective for less than 50% of women. Recent evidence suggests that the gut microbiome is integrally involved in maternal glucose homeostasis. Changes to the composition and metabolic behavior of the gut microbiota may play a role in the development and persistence of neonatal diabetes mellitus. Thus, there is growing interest in

In SELEX experiments, FUS binds the RNA motif GGUG; it also binds single-stranded G and U homopolymers as well as ssDNA and dsDNA (Lerga et al. 2001). FUS interacts with auxiliary splice factors of the SR family and hnRNPs and can influence alternative splice site selection in cell-free systems, possibly by acting in the spliceosome assembly (Lerga et al. 2001). Furthermore, FUS has been shown to inhibit RNA polymerase III transcription (Tan and Manley 2010) and bind noncoding RNAs transcribed from the promoter region of Ccnd1, thus repressing its transcription (Wang et al. 2008). While FUS has been studied in some detail in vitro and in cultured cells, less is known about its physiological function in whole organisms. In a mouse gene trap screen, a Fus mutant with an insertion in exon 12 suffered perinatal death, possibly due to lymphocyte defects and chromosomal instability (Hicks et al. 2000).

For colorectal cancer screening, we examined the meta-analyses conducted by the Cochrane Collaboration in 2008<sup>11</sup> and the US Preventive Services Task Force report in 2008<sup>1</sup> and identified four trials. All four trials met inclusion criteria and were included in our meta-analysis: Minnesota,<sup>20 21</sup> Nottingham,<sup>18</sup> Funen,<sup>17</sup> and Goteborg (fig 1).<sup>19</sup> The Minnesota study had two intervention arms (annual and biennial screening), each compared with the one control arm; we split the control group and entered the two intervention arms separately into our meta-analysis.<sup>35</sup>
