Cancer

Le cancer est une maladie caractérisée par une prolifération cellulaire anormalement importante au sein d'un tissu normal de l'organisme, de telle manière que la survie de ce dernier est menacée. Ces cellules dérivent toutes d'un même clone, cellule initiatrice du cancer qui a acquis certaines caractéristiques lui permettant de se diviser indéfiniment. Au cours de l'évolution de la maladie, certaines cellules peuvent migrer de leur lieu de production et former des métastases. Pour ces deux raisons, le dépistage du cancer doit être le plus précoce possible.
